

Evidence for gating and overwriting in one Qwen3-8B testbed

Strong IP (arm 6, amber) is readily reversible: steering (A) and the same generic prompt (B) restore sycophancy. Patching arm 1's residual state into CRT repair also restores it partway (C). CRT repair (arm 4, clay) moves the weights most (D) and is much harder to restore. Together these results support a gating versus overwriting account.

A · Steer the direction back in

B · Re-prompt the behavior

C · Transplant the internal state

D · Measure the weight change

Gate = behavior readily restored. Overwrite = behavior harder to restore, with larger weight change and contrarian overcorrection.
