

The weight change: IP is a small, distinct nudge; CRT repair is the largest rewrite

Left: CRT repair (arm 4) moves the weights most; Strong IP (arm 6) moves them least — below the sycophantic baseline.

Right: the two CRT arms (3,4) share a direction (0.64) and the IP arms (2,5) share another (0.73); arm 6 is the outlier.

How far the weights moved

Which direction they moved (cross-arm cosine)
